

**METHOD, COMPUTER READABLE MEDIA AND APPARATUS
FOR THE SELECTION AND RENDERING OF AUDIO FILES IN A NETWORKED
ENVIRONMENT**

5

Abstract of the Disclosure

10 A networked virtual jukebox renders audible music or other audio files to all within audio range of the virtual jukebox. The order of rendering is determined by requesting methods, which include networked peer-voting input, recent play history, random selection and voting. Voting is received from each networked device in communication with the networked virtual jukebox using all types of input methods such as keyboard, mouse, and voice input. The networked virtual jukebox can also operate unattended by playing music and/or audio files based on random selection of past voting.
